COMMENTS TO AUTHORS

This case report is interesting and well written, with significant images and video, and should be considered for publication.

COMMENTS TO AUTHORS

This is an interesting case report about the interventional treatment for PDA with long occlusion using direct stent puncture technique. This manuscript is nicely structured and well written. I have no question about this manuscript.

COMMENTS TO AUTHORS

The authors reported a case of peripheral artery disease with critical limb ischemia, which were treated by two sessions of endovascular treatment. This case report is interesting and the qualities of images were good. As a reviewer, I have requests as below. 1) The one of theme of present case report is the direct-stent puncture technique. Thus, the authors had better add the discussion about this technique in the "Discussion" section. 2) If the authors have available data about ankle-brachial index or skin perfusion pressure, they had better provide such data.

COMMENTS TO AUTHORS

"Successful Retrograde Recanalization of Long Femoro-crural Occlusive Disease Using the Direct Stent Puncture Technique in a Patient with Critical Limb Ischemia after Failed Bypass Surgery" by Dr Korosoglou and colleagues is a case report that highlights the importance and advantages of "endovascular first" approach in critical peripheral vascular ischemia. The subject is among interesting topics to cardiologists and warrants meticulous attention. However, The authors are recommended to extend discussion to cover a literature review on history of similar works and a comparison of their case with other reports. Moreover, they are expected to provide more information on their patient. In deed, except for the age, we don't know anything about this patient.
