COMMENTS TO AUTHORS

The objective of the intensive care units is to modify the mortality caused by the occurrence of acute insufficiencies of one or more organ systems. However, it is a fact that there are certain patients who do not benefit from the management of the ICU. Therefore it is necessary to establish criteria for ICU admission. The authors, in a brief but illustrative review identified the main risk factors for better selecting patients undergoing hematopoietic stem cell transplantation for intensive care. The manuscript describes a well-conducted study, the risk factors are well identified and the conclusions (future objectives and recommendations) are clearly reasoned and exposed.

COMMENTS TO AUTHORS

In all, you did a good job in studying intensive care outcomes after cell transplantation. Stem cell treatment is the tendency of medical development. It is very meaningful to study the intensive care outcomes after cell transplantation which is helpful in better selection of HSCT patients for intensive care and consequently reduction of non-beneficial care. You reviewed the studies on intensive care outcomes of patients undergoing HSCT published since 2000 and summarized them. What's more, you also made future objectives and recommendations to physicians and researchers. All in all, this research is worth publishing and pretty significant.
