SPECIFIC COMMENTS TO AUTHORS

The authors present an interesting descriptive study. Because of the descriptive nature

some paragraphs read repetitive (ie, the first paragraph of the discussion). In the conclusion section the authors wrote: “ To the best of our knowledge no comparable study exists which shows the variety of injuries in airborne sports. Contrary to the literature, not the lower extremities but the spine and thorax were most commonly affected in our cohort”. Both sentences are contradictory (no comparable study vs. contrary to the literature). It is not the only study analyzing this type of patients. The authors state that severity of injury was analyzed using ISS distributed per areas. It would be interesting to analyze the values of the Abbreviated Injury Scale in the 6 areas. IRB approval provided does not seem to correspond to this study English and american english are used. Please, unify.
