SPECIFIC COMMENTS TO AUTHORS

AUTHORS Manuscript NO: 53408 Title: The Kitesurf Injury Trauma Evaluation (KITE) study: A prospective cohort study evaluating the epidemiology of kitesurf injuries This is a study on the incidence and epidemiology of kitesurfing injuries in a Dutch cohort (N=194) during a kitesurfing season. This study is very well designed and provides novel (and interesting) data on this sport. The relevance of the results is also high. For all the above I advise publication after minor modifications/clarifications. I believe there are a few recent (2017-2019) studies on kitesurfing injuries that could be helpful in adding to the introduction for a more robust explanation on the topic Please define the start and end of the kitesurfing season On results authors describe "The majority of the injuries were sustained in wind speeds of 4-6 Beaufort and flat to small wave (choppy) conditions, which are typical Dutch conditions.". I believe this is the first opportunity for the reader to observe that all kitesurfing was done on the Netherlands and not abroad. Is this true? I advise clarification in Material and Methods I am not a statistician but ORs were calculated with a chi-square? Are these adjusted or crudes?

SPECIFIC COMMENTS TO AUTHORS

A prospective, cohort study. Little is published on this subject. The paper follows an established methodology for reporting sports related injury such as a paper published by myself. (S. Gartland, M. H. A. Malik, M. E. Lovell. Injuries and injury rates in Muay Thai Kickboxing. Br J Sports Med 2001; 35: 308 – 318.) It would be of benefit to list the fracture types and treatment (operative or conservative) and also if any soft tissue injuries required operation.
