### COMMENTS TO AUTHORS

The authors have put forward an important and vital issue regarding endotracheal tubation process which is a general practice in many severe conditions and thus affects a large number of patients. The problem discussed by the authors is of great clinical importance and is worth reconsidering. The suggested changes to the cuff pressure management protocol appear to be rational and practical. The manuscript is well organized and has a good flow of the content.

### COMMENTS TO AUTHORS

“The Critical Importance of Tracheal Tube Cuff Pressure Management” is a well-written editorial. The footnote regarding the reference (5) can be added to the main script... .....As far back as 1999, the third author had described how a continuous digital display of ETT cuff pressure using an ordinary patient monitor with invasive pressure capability can be obtained..... (A diagram with this would be useful.) Typo error in the last paragraph: “rasies” instead of raises
