COMMENTS TO AUTHORS

The manuscript is a good review article from an expert. However, restructuring with emphasis on the NHS-UK experience will be informative. The author's experience with Sugammadex in NHS is discernible. Abstract should not contain references. Abstract is not covering the important elements of the manuscript to be understood alone. the first paragraph in the abstract can move to the introduction (to be created). Auditing the UK-NHS experience is very interesting and the delineated guidelines are useful. it might be better to insert late in the manuscript.

COMMENTS TO AUTHORS

The author presents a problem we have faced many anesthesiologists to enter the sugammadex in our hospital pharmacies: the development of a clinic guideline for the administration of sugammadex . The presentation of the guidelines in this manuscript and its application development is an important innovation. But I ask the author's data on the implementation of the guidelines. How many surgical interventions have required the use of muscle relaxants? How many surgical interventions have been used rocuronium? How many has reversed with sugammadex? Have there been any adverse effect on your application? Its experience with the clinical guidelines and contrast it with that of other hospitals if that would make a significant contribution to the scientific community. Regarding the development of the safety aspects and economic sugamadex, the text is well structured and the review of the topic is concrete and perfectly accurate but could be part of the discussion of the manuscript and not raise it as the main objective. There is plenty and extensive literature on economics and security sugammadex. The idea is good but I suggest major changes in the text.
