COMMENTS TO AUTHORS

This is an interesting review article regarding the cutaneous implications of essential oils. In general, the article was well-written, the information was scientifically interesting and clinically relevant, and the references were sufficient.

COMMENTS TO AUTHORS

Interesting review of essential oils in dermatology. I would suggest adding a table at the end summarizing the review by listing the common essential oils with their indications/possible side effects and if relevant level of evidence for use

COMMENTS TO AUTHORS

The new therapeutic tendencies include “natural” compounds, especially for chronic diseases. A lot of cosmetic products, dermato-cosmetic or cosmeceuticals have in their content botanic compounds known for their effect. It is salutary to have a review on the essential botanical oils, as long as there is an increase of their use (on prescriptions or self-administrated). There are many studies on the effects of essential oils in skin diseases and I suggest the authors to do a systematic review, not only the effects on acne, dandruff, alopecia areata or hyperpigmentation. There are papers on: atopic dermatitis, psoriasis, chronic wounds, seborrhea, mycoses, scabies or head lice. On the other hand, there is also a tendency to reduce the presence of fragrances in the products recommended for sensitive, allergic skin. It is important to know the potential adverse reactions as long as the myth related to plants is “being inoffensive”.
