COMMENTS TO AUTHORS

This review article has a high scientific value and will contribute to the readers in clinical practice. "Operative evaluation of macroscopic characteristics predicting potential of malignancy in adnexal masses" is more appropriate in the title of Table 1. Please revise a style of Ref No. 59.

COMMENTS TO AUTHORS

The manuscript concerns the role of laparoscopy in the management of ovarian masses and malignancies. The title refers only to ovarian cancer and not to the evaluation and management complex adnexal masses, which consists of a very large part of the manuscript. The title suggests a real update of the role of laparoscopy in these tumors, but as the authors conclude the data are too limited for definite conclusions. Hence, to refer to an update results in too high expectations that cannot be fulfilled. The discussion of adnexal masses and ovarian malignancies themselves is too extensive and should be more focused on the role of laparoscopy. The manuscript should be better structured. Data from borderline tumors are also discussed in the early ovarian cancer section. In the paragraph on port-site metastasis in the early ovarian cancer section data of patients with ascites, so with advanced ovarian cancer, are discussed. The manuscript should be less a series of data of various studies and more an interpretation of these data. Linguistic review is definitely required.
