COMMENTS TO AUTHORS

In the manuscript "Emergency Contraception-What is New?", Dr. Kelekci S et al reviewed the most currently used emergency contraceptive methods for their indications, effectiveness, safety, contraindications, and drug interactions. Emergency contraception after unprotected intercourse is a very important issue in clinical practice since it resulted in unplanned or unwanted pregnancies. Most of the unwanted pregnancies happened in young women. Most women with unwanted pregnancy choice abortion to terminate. This situation happened more in developing countries. It affects the woman's health and influences their normal life. This review will help clinicians to choice the right methods to prevent unplanned pregnancies after unprotected intercourse. Suggestion: The emergency contraceptive methods are discussed individually in the manuscript. It will be more clear and understandable for clinicians if the author could present these methods in a table. The table may includes EC methods, effective time, side effects, indications, contraindications, etc.
