## COMMENTS TO AUTHORS

Well done! This is a great review of the literature on the genetic risk factors of women's breast cancer.

## COMMENTS TO AUTHORS

Comments: The authors reviewed the gene testing and risk-reducing interventions for hereditary breast cancer. The clinical significance of high- and moderate/low-penetrant genes for the development of breast cancer was expounded. The authors claimed that identifying women who should undergo genetic counseling and implementing recommended guidelines can reduce the incidence and mortality of breast cancer. This manuscript provides useful information to the medical students, clinicians, and researchers in this field, therefore, is acceptable for publication in World Journal of Obstetrics and Gynecology. That is all.

## COMMENTS TO AUTHORS

I congratulate for the review, which fully describe the risk and prevention for breast cancer and the genetic aspect are fully described.
