## COMMENTS TO AUTHORS

In this review, Dr. Riiser has gathered the evidence from the literature on the prevalence and development of BHR in children in addition to childhood BHRs predictability for asthma in late adolescence and adulthood. It is a nicely written article, with adequate documantation on an interesting topic. Minor criticism 1. Minor language polishing is needed in 4-5 spots within the text. 2. It would be more attractive for the reader if the author added a figure showing the mechanism of action in direct and indirect challenges instead of describing in the text. 3. A Table showing the cut-off points for a positive test in children according to guidelines for each provocation test used would be also useful.

## COMMENTS TO AUTHORS

1.Many contents in this review article come from the reference 31( AJRCCM 2012) . However the article is a well known study for bronchial hyperresponsiveness. I think you should shorten the redundance and rewrite the paragraph of "BHR predicts asthma" 2.There are still some mistakes at spelling. such as: page 1, line 9: conflict of interest page 3, line 9: CD4+ Th2 cells page 6, line 6: suggests
