COMMENTS TO AUTHORS

Authors provide a detailed systematic review and an additional case for AMG. The paper is well but includes several problems. 1. Clinical presentation and diagnostic assessment MRCP is very good to show the biliary tree. MRI, especially T2WI and contrast enhanced MRI, have been used for the evaluation of gallbladder diseases. So, to suggest adding a few AMG MR findings. 2. FIGURES The gallbladder is not showed goodly in Fig A. The diffuse thickening of the gallbladder, with multiple anechogenic nodular areas mainly localized in the fundus and in the body in the additional case. But only neck of gallbladder or cystic duct is showed in Fig A. To point out the lesion in figure A and B, please. If possible, to add coronal T2WI and contrast enhanced images of the lesions.

COMMENTS TO AUTHORS

Adenomyomatosis of the gallbladder in children is a very rare disease. This paper introduced a case report and a systemic review, which had a clinical guiding influence.
