COMMENTS TO AUTHORS

Reasonable review of a perhaps long overlooked risk factor. It might be helpful to note that microalbuminuria - a major CKD risk factor - is now appreciated to be reversible spontaneously in as many as one-half of those afflicted. It might be helpful to include the suggested features of a prospective study to fully define the risk post by Periodontitis in both CKD and ESRD. The point that attention should be paid to detect its presence is valid and helpful.

COMMENTS TO AUTHORS

Minor comments: 1.The first paragraph at definition section should be rewriting . Table 1 is redundant and could be deleted. 2.The term of "Impact" is better than the term of "effect":at page 5: "effects" of chronic renal disease on periodontal tissues----

COMMENTS TO AUTHORS

In this manuscript, the authors review the recent evidences pertaining to the association between periodontal disease and a variety of renal maladies. It is an interesting review. The reviewer has the following comments/question. 1. The authors mentioned that CKD population is increasing. It will be helpful to readers if they could provide some numbers. For example, how many CKD worldwide, how much for medical care and subsequent costs, etc. 2. Same for periodontal disease. How many worldwide, how much for medical care and subsequent costs, etc. 3. Same for the link between periodontal disease and CKD. In comparison to the general public, is the % of periodontal disease in CKD much higher? Is it progressive depending on the CKD stages? 4. In addition to affecting inflammatory markers, will periodontal treatments affect CKD outcomes such as cardiovascular morbidity and mortality? From Fig. 1, it seems that it should. If no evidence exists to show that periodontal treatments affect CKD outcomes, then perhaps Fig. 1 and its related texts need to be modified.

COMMENTS TO AUTHORS

This is overall an intriguing topic. I found it too verbose at times and superficial in referring to the published work. It would help if some more details of suggested mechanism are presented. It is not clear whether there truly is an impact of periodontitis on CKD or vice-versa. CKD patients in general suffer from chronic inflammation which is bound to affect several systems, gums being no exception. The manuscript is too long and information is repeated over and over which is totally unnecessary. English language should be improved.

COMMENTS TO AUTHORS

The article is quite well written and easily understandable . According to my personal opinion from a periodontal point of view the paper deserve to be published after minor polishing as follows: page 4 row 18 instead of “ plaque-induced gingival disease, early onset, chronic adult and aggressive periodontitis. Plaque-induced gingival diseases (briefly called gingivitis) involve” write “ plaque-induced gingivitis, chronic and aggressive periodontitis. Plaque-induced gingivitis involve” row 22 instead of “ other three conditions. “ write “ other two conditions. “ page 12 row18 instead of “in PD patients. And periodontal treatment” write “in PD patients and periodontal treatment” page 15 CONCLUSION row6 after “the most prevalent finding” add “ due to cyclosporine mediated mechanism. “ table 4 Bone Instead of “ Lytic areas of bone” write “Osteolytic areas “
