COMMENTS TO AUTHORS

Thank you for this nice review, certainly anything we can do to improve our knowledge and treatment of enuresis is welcome. Furthermore, we may help identify a true health risk in an otherwise benign-appearing complaint. > my main concern is that your review focuses on a number of manuscripts, but your recommendations do not seem to use their findings. For example: Recommendation 1) What criteria is a urologist to use to determine the risk of SDP? Bascom et Al., recommended the presence of snoring as an indication for referral to ENT / otolaryngology / or sleep medicine. There are at least two well validated questionnaires that are also used as screening tools (OSA-18 and PSQ). Recommendation 2) Again, the general practitioner needs to have a criteria for diagnosis / screening tool Recommendation 3) How do you define refractory enuresis? Recommendation 4) Are you suggesting that all patients seen for enuresis (regardless of snoring, questionnaire scores, or clinical success) undergo polysomnography? If so, this would negate your suggestions in 1-3.

COMMENTS TO AUTHORS

This is a well-written editorial on a very important topic. Comments: The article heavily focuses on clinical associations paying little attention to mechanistic correlations of SDB and NE. Please provide a brief description of differences between central sleep apnea and obstruction sleep apnea. Do both conditions correlate with NE or obstructive type only? Please spell out SDB in the second paragraph of introduction. Introduction, third paragraph, last statement: It is stated that both NE and SDB are sleep disorders. These are urological and respiratory conditions associated with sleep but should not be categorized as sleep disorders.
