SPECIFIC COMMENTS TO AUTHORS

Ultrasonography, including point-of-care US is 'coming-of-age' in ICUS on multiple sites. The discussed ONSD measurement likely to effective and suitable for serial measurements, offering relief form MRI/CT technologies – which represent significant disruption of ICU care, nursing time.... And expense/radiation load / contrast risk are the least concerns, in these vey ill subjects. Suggestions for improvement /question:

GENERAL COMMENTS Could the Authors report on partial correlation of major positive results, not just the p values? It would be nice to know, whether any closer association persist between type of CNS lesion and ONSD ... I realize the numbers are small; but may be if just reporting on association between septic-medical scenario (~25% of the cohort) vs others... this may be relevant, as one would think optic nerve lesion more like to be detected in lesion of frontal brain compartment What is missing; serum Na⁺ (sodium) values. Many of these patients will receive medical therapy to address brain edema and such intervention may affect the relation hip between anatomic lesion vs degree of optic nerve edema. Similarly – how many of these patient had acute kidney injury (AKI); would also recommend reporting on serum creatinine values at the time of study's enrollment Discussion should be enriched by the following paper: [PMID: 31789653]; [PMID: 30848433] Improve Write-up: ABSTRACT: 1. "Raised ONSD was associated with lower age (p=0.007), poorer GCS (p=0.009) and greater need for surgical intervention (p=0.006)..." to " Raised ONSD was associated with younger age (p=0.007), lower GCS (p=0.009) and greater likelihood for surgical intervention (p=0.006) " [here, the partial correlate [r] values would be very helpful to show, as well) 2. "ONSD can be used as a screening a test to detect raised ICP in a medical ICU and can used as a trigger

to initiate further management of raised ICP.” – would tone this a little bit down, as follow : “ ONSD can be used as a screening a test to detect raised ICP in a medical ICU and future potential as threshold trigger to escalate management of raised ICP. “ 3. Last sentence (“ “) s supported only by literature review and I believe not the Authors’ primary data. Thus I would eliminate this from the Abstract’s Conclusion (from main paper, as well) MAIN Paper Methods: please list Ethic Committee approval number, for the record Results: for key results, beyond p values, report also partial correlations, as well Minor comments: Sentence: “ simple bedside test, which has a small learning curve, ..” to: “simple bedside test, which has a rapid learning curve, ...”

SPECIFIC COMMENTS TO AUTHORS

The authors deserve compliments for the conducted study. The materials and methods are well-written. I have few suggestions for the authors. 1. kindly check grammar and make the manuscript more fluent. 2. lots of passive voice statements. 3. kindly mention how was sample size calculated 4. Criteria for selecting 3mm distance from the optic disc is it universal?? 5. Diabetic status and its effect on ONSD? 6. the above points and their justifications and addition in the manuscript adds to the strength of the discussion.
