COMMENTS TO AUTHORS

The Author, Dr. Guertin, discusses the presence of future potential of new non-invasive pharmacological approaches against chronic bowel and bladder problems associated with traumatic or non-traumatic spinal cord injury. The Author concludes that no safe or acceptable treatments have been found so far. Pharmacological or electrical modulation of spinal command centers involved in controlling micturition and defecation behaviors might eventually constitute rather selective, specific, and hence safe treatments. The Author needs to address the following concerns or questions. The Author argues a wide and complete overview on current research status and future directions about this topic. The manuscript is well written, although the title is too long and not impressive. Several references are very old and should be updated. The written English is correct and appropriate.
