COMMENTS TO AUTHORS

The paper by Carrasco et al. describes a study on a new combination of sevoflurane dilution in dimethyl sulfoxide at different concentrations. Results shown that sevoflurane solutions maintain their chemical composition even after exposure to different temperatures and for a period of 45 days. Therefore, the authors suggest that these findings could represent an important step in the pharmaceutical formulation of topical sevoflurane solutions. In my opinion the study is detailed and well-made and the paper accurately written. The results reported in this study have been obtained by gas chromatography and NMR experiments, clearly and precisely described. For these reason I consider this paper worthy of publication in World Journal of Pharmacology.
