SPECIFIC COMMENTS TO AUTHORS

The editorial entitled "The legacy of neuropsychiatric symptoms associated with past Covid-19 infection: a cause of concern" by Domenico De Berardis et al., addresses an important issue currently of significant concern worldwide. The authors outline the evidence of neuropsychiatric complications associated with previous and actual coronavirus infections. They make special emphasis on the long-term neuropsychiatric sequelae of COVID-19 infection and discuss the effects that this will have in the long-term. Apart from discussing the possible mechanisms associated with these consequences, they raise awareness to pay special attention to the survivors of COVID-19 to prevent or anticipate possible complications. And also propose to start thinking about treatment approaches that have been used in other neuropsychiatric disorders, to be used in those who contracted COVID-19. The editorial is well-thought, well written and summarizes important information.
