COMMENTS TO AUTHORS

This paper is well-written. LDLT provides a valuable alternative with excellent results in children with hepatoblastoma, because it allows optimal timing of the liver transplantation, given the absence of delay between the completion of chemotherapy and planned liver transplantation. Selected pediatric patients showed an acceptable 5-year survival rate of >90% (Am J Transplant 2005 5 (9):2229). 1. In reference list, some important papers of LT for pediatric hepatoblastoma are not listed. Please add important papers in your Reference section.

COMMENTS TO AUTHORS

- 1) The review indicated that the advantages of liver transplantation in treating HB, especially authors' experience and opinion about liver transplantation in treating HB. But some data of the advantages and disadvantage of liver resection for HB should be supplemented to compare with liver transplantation.
- 2) Some data should be supplemented to compare the difference between deceased liver transplantation and living donor liver transplantation .
- 3) I suggest that the article need to be reviewed again after supplement.
