COMMENTS TO AUTHORS

The authors have presented their successful management of a rare case of osteomyelitis of sternum and clavicle in a renal transplant recipient, without involvement of the sternoclavicular joint in between the two, which is a very unusual presentation. This condition has not been described previously in transplant recipients and does have educational value.

COMMENTS TO AUTHORS

The authors describe a very unusual complication occurring late after renal transplantation. The case report is well written and useful for the reader just because of the unusual complication.
