COMMENTS TO AUTHORS

The retrospective study on the connection between LT patients' postTX histological result and QOL is very interesting. The results are objective and seem to be valid. The explanation of the results are clear and logical. Some minor points need revision: - some typos can be found in the tables (i.e. cirrhosis, VHC infection etc.). These must be corrected - what about the physical activity of the TXed patients? Did they do some sport? If yes, how did it influence their well-being? - what about the recurrence of immune-mediated hepatic diseases (PBC? AIH? etc.) After minor revision I suggest to accept the manuscript for publication.
