SPECIFIC COMMENTS TO AUTHORS

In this mini review, the authors discuss the existing literature on the late conversion of CN1 agent to everolimus in kidney transplant recipients. The article is written well. The main issue with using mTOR inhibitors including evrolimus is propensity for adverse

side effects profiles including mouth ulcers, hyperlipidemia, proteinuria and rarely pneumonitis along with higher discontinuation rates. There is also concern for the development of DSA and chronic AMR since documented risk factor for DSA development include subtherapeutic CNI level. This should be mentioned. Conversion to mTOR inhibitor has clearly shown to reduce recurrence of non-melanoma skin cancer. It will be nice to include a table stating the indications for late conversion along with a description of the pros and cons of CNI elimination and conversion to everolimus.
