COMMENTS TO AUTHORS

A reasonable first analysis of congenital pediatric renal disease in a previously unstudied population with findings in the range of what might have been predicted. Lacking an updated prevalence of the same renal disorders in a young adult population, it is not possible to comment on the relative virulence of the Pediatric Renal Disorders noted without some general statement as to their prevalence in adults of the same population cohort. It would assist the Reader to have a listing of Definitions for all terms used including that of what are the years of Pediatric Medicine and exactly what prevalence in young Brunei adults is noted for the key disorders discussed. A comment on the prevalence of End Stage Renal Disease (ESRD) in Brunei as well as the general Life Expectancy for young adults in Brunei would afford further understanding of the population under study.
