COMMENTS TO AUTHORS

Well characterized story of Sleep Disorders in patients with Chronic Kidney Disease as well as in those whose renal disorder has progressed to End Stage Renal Disease meaning that without treatment by some form of Dialysis or a Kidney Transplant, death must be anticipated. Collecting the key references and analyzing current therapies may have the desired result of stimulating larger trials of various therapies that might prove beneficial as distinguished from others that actually are of minimal benefit. One additional feature of this report would be an Author Proposed Action Plan to assist clinicians confronting new patients with Sleep Disorders. Is there a sequence of preferred tests that should be performed? Are some medications more beneficial than others? Especially needed is the Authors Approach to Geriatric Hemodialysis Patients complaining of sleep deprivation. Can a suggested sequence of tests and therapies now be prepared realizing that it is desirable to collect data from larger trials to obtain statistically reliable therapies. Overall a paper of substantive interest to Clinical Nephrologists.
