COMMENTS TO AUTHORS

A positive trial of a potential pediatric preventive intervention to block both autosomal recessive polycystic kidney disease (ARPKD) and autosomal dominant polycystic kidney disease (ADPKD) by administration of multi-kinase inhibitor drugs in mice with genetic predisposition to PKD. There is strong reason to hope that trials such as this positive mouse study will stimulate broader clinical trials that will define a regimen to preempt genetic cystic kidney disorders. This study in mice is well done and thought stimulating.
