

Response to Reviewers 1

Dear reviewer,

Thank you very much for sparing your precious time to review my manuscript in detail. We have revised and completed your suggestions. We summarize the reported cases of primary gastric ES in Table 1, describing their clinical presentation, immunohistochemistry and molecular findings, treatment, and outcome. The manuscript should include color drawings of FISH made by West China Hospital of Sichuan University. We are sorry that we cannot make use of them. We have detailed in the discussion section the pathologic differential diagnosis of other small cell tumors in this rare tumor. Thank you again for your revision.

sincerely  
Qiang Shu

Response to Reviewers 2

Dear reviewer,

Thank you very much for sparing your precious time to review my manuscript in detail. We have revised and completed your suggestions. I have revised the manuscript in strict accordance with the requirements of wjcc journal, and the core tips have been revised. Thank you again for your revision.

sincerely  
Qiang Shu

Response to Reviewers 3

Dear reviewer,

Thank you very much for sparing your precious time to review my manuscript in detail. We have revised and completed your suggestions. The patient did not receive vagotomy, we performed radical tumor resection for primary ES. In the follow-up, the patient had a good appetite and did not complain of abdominal pain and distension after intake of food. Preoperative CE USG and CECT scans were performed for this patient to further identify the diagnosis. When we consider tumor from the stomach, we conducted Esophagogastroduodenoscopy. Unfortunately, we did not obtain a tumor specimen for a definitive diagnosis by pathological examination. Thank you again for your revision.

sincerely  
Qiang Shu
