

Reviewer's Comments:

In this manuscript, the authors present a case of Uterine artery embolization combined with percutaneous microwave ablation for the treatment of prolapsed uterine submucosal leiomyoma. The title is complete and informative. The abstract is complete and informative however I suggest summarizing the case and deleting unnecessary information. Introduction: This part is complete.

Response to the reviewer:

Thank you for reviewing this manuscript with constructional suggestions back. We appreciate it very much. The abstract part was summarized in a more simple and clear way with unnecessary information deleted.

Reviewer's Comments:

Case presentation: the case is very interesting and presents a "tailored " approach to the patient's condition. However, there are many datas that are unnecessary and this part can be rewritten in a more clear and more "medical" way. The Discussion part is complete and informative. The topic is novel and represents a great point of discussion.

Response to the reviewer:

Case presentation part was rewrote all over again and simplified in a more clear way. We hope you find that the readability of the revised version has improved significantly. Thank you in advance.
