In recent years, the incidence of the disease has gradually increased due to people's increasing work pressure and irregular lifestyles. Thyroid-stimulating hormone is a glycoprotein hormone synthesized and secreted by thyroid cells in the anterior pituitary gland and plays a regulatory role by acting on the thyrotropin receptor on the cell surface. In this study, the authors investigated the effects and safety of thyroid-stimulating hormone on the clinical treatment of TC patients by analyzing the clinical data of TC patients, hoping to provide more references for the early diagnosis and treatment of TC patients. The study is overall well designed and the results are interesting. After a minor editing, the manuscript can be accepted for publication.

1. Some minor language polishing should be corrected.

Response: Thanks for your suggestion. The language has been checked by an English expert and revised.

2. References list should be edited and updated.

Response: Thanks for your suggestion. We have updated the References list.
