

Reviewer 1

1. In the CASE SUMMARY section (line 39)," and prolactin (PRL) levels were elevated " is misstated.

Responses:

Sorry for the mistake. We revised it on page 2 line 10 in the manuscript.

2. With the "transsphenoidal surgery" of this disease having been recommended before, although the author has used this surgical scheme and had a good outcome, it is suggested to elaborate on new developments such as Gamma knife radiosurgery (GKRS), which may help readers to keep abreast of the latest developments.

Responses:

Thank you very much for the suggestions. We elaborate GKRS on page 8 line 21-26.

3. The functioning gonadotroph adenoma can occur in postmenopausal women, men, or children, and it is recommended that it be mentioned in the discussion.

Responses:

Thank you for your advisement. We now add this information on page 6 line 11-15.

Reviewer 2

The case report has some English grammar and syntax-related errors.

Responses:

Sorry for the errors. The manuscript is now carefully revised.

Suggest authors revise the title. The title is too long and wordy.

Responses:

Thanks. We revised it on page 1 line 5-6.

Suggest authors mention the practical teaching point of this case report.

Thanks. We mention it on page 9 line 3-6.
