

Dear Reviewer **00227683**

Thank you for the comments. The timing of the contrast administration and imaging studies have been clarified in the manuscript. A repeat imaging of the head was not obtained as patient clinically made a remarkable recovery with aggressive dialysis and supportive care. Typographic error has been corrected as highlighted in the revised manuscript.

Dear Reviewer **00722122**

Thank you for the comments. Typographic errors have been corrected as highlighted in the revised manuscript. Changes have been made to the discussion and conclusion sections of the report. Page numbers have been added to the manuscript.

Dear Reviewer **00724151**

Thank you for the kind comments

Dear Reviewer **00740391**

Thank you for the comments. This case report highlights the rare but potentially life-threatening adverse reaction to iodinated contrast agent following coronary angiogram and intervention, and brings to attention the role of hemodialysis in the management of such adverse reaction when supportive care alone is not sufficient.

Sincerely,

Narasimha Swamy Gollol Raju
