ESPS Manuscript NO: 24887

Manuscript Type: ORIGINAL ARTICLE

Dear Editor and Referees,

Please find the answers to the referees comments: changes are highlighted in the text in red.

This paper is a single case report, so we don't have biostatistics statement or ethical committee statement or review institutional board: we have to provide some other document?

For any query please do not hesitate to contact me.

Kind regards

Carlo Fornaini

### COMMENTS TO AUTHORS 1

Interesting case report of the use of blue diode laser for the removal of oral and intraoral soft tissue benign tumors. The case report is well written with a comprehensive description of the application of the blue diode laser.

The discussion is supported by a long list of references but the language needs careful consideration by an English native speaker.

Thank you for your suggestion: we required the check of the manuscript to an English native speaker.

### COMMENTS TO AUTHORS 2

This is an interesting and thought provoking case report of some merit. I really appreciate this excellent case.

I have a number of concerns:

- 1- what is the protocol of laser used in this case

We added the values of Fluence and Power density in order to complete the protocol informations.

- 2- how the pain was evaluated post-operative.

We specified that we used a record of pain intensity with VAS and NRS.

- 3- is there was re-evaluation of the case after one week.

As described in the text and showed in the last picture, we performed the evaluation 7 days after surgery when we observed the complete healing of the surgical site and we reevaluated the patient at 1 and 3 months after surgery without any sign of recurrence.
