**Comments:** It is an interesting review about the complications following the percutaneous vertebroplasty, mainly about the occurrence of spinal subdural hematoma. The authors describe a clinical case of their own and review other 4 clinical cases described in the literature. The English is good. We only found one error in the Abstract - Methods: where it is "Trying to explain the pathogenesis, we support the apotheosis that both venous..." it should be "Trying to explain the pathogenesis, we support the hypothesis that both venous...".

**Response:** We are very proud to give our contribute for improve the clinical practise.
