

Dear Editor,

Thank you for the revision and all the suggestions. We have revised the manuscript taking into consideration your suggestions.

- 1) The article highlight section was uploaded
- 2) The first two reviews had no further comments
- 3) According to reviewer 03105713:

- We gratefully accept the suggestion about endoscopic findings of our case and have attached figure which might help physicians with diagnostics in the future.

The figure No. 2 was added.

- While the case-report is not an original one, it is extremely rare and we believe this manuscript is unique. To our knowledge, an attempt for endoscopic treatment (EUS-guided transgastric drainage of the cyst) was made for the first and showed only temporary effect.

This information was integrated into the manuscript.

- The article was shortened.

- Laparoscopy may be considered in similar cases. **However due to preoperative findings, including history of acute pancreatitis and transgastric drainage a long operating time was expected. Considering this with a focus on the patient's safety an open approach was chosen.**

Your sincerely

Miroslav Ryska
