SPECIFIC COMMENTS TO AUTHORS

This is an interesting and accurate manuscript. It is well-written and provides useful information. There are only some very minor stylistic issues.

SPECIFIC COMMENTS TO AUTHORS

To: Editorial Board World Journal of Clinical Cases Title: "R/S Ratio in Lead II And the Prognostic Significance of Red Cell Distrubition Width in Acute Coronary Syndrome"

Dear Editor, I read this manuscript and I think that: - The results section of the abstract is poorly written. Please include more numerical data. - Decimals deserve dots rather than

virgules. Please revise the entire manuscript. - Please revise the typos of the paper. For example, please revise the term “distrubition” into “distribution”. - The retrospective nature of this paper is a limitation of the study design. Please discuss such a point in a dedicated limitation section. - ALL of the clinical and biochemical characteristics of the study population should be included in table 1. As it stands, table 1 is very poor. - The clinical background about the relationship between ECG and RDW should be better expressed in relation to literature. - A multivariate regression analysis should be considered and should include all the characteristics of the study population, in order to evaluate the role of confounding factors on final results. - The role of diet and nutraceuticals on health should be considered. The authors can consider the paper from Scicchitano P et al Journal of Functional Foods 2014;6:11-32.

Reviewer's code: 02520738

Answer:

First of all, thank you for your help.

All the points you specified were carefully evaluated.

1. Massage has been reviewed. Corrected the bad software with a professional team again.

2. The numerical figures in the summary are increased.

3. The decimal point comma was used.

4. Correct spelling errors.

5. All tables are simplified and revised. Table 1 was strengthened.

6. The effect of RDW on prognosis was enhanced.

7. Single and multivariate regression analysis were taken into consideration in the discussion.

8. The language was revised again by a professional team.

SPECIFIC COMMENTS TO AUTHORS

The authors investigated the prognostic influence of R/S ratio in II leads and red cell distribution width (RDW) in patients with acute coronary syndrome (ACS). This study included a lot of patients and seems to be unique, however, there are several problems to be solved.

#1 In the two groups based on the R/S ratio, the components of ACS were different. Thus, it seems to be difficult to compare the prognosis in 2 groups. Even in the ST elevation myocardial infarction, the prognosis is different between acute inferior infarction and acute anterior infarction. Thus, the authors should select each disease of ACS and compare the prognosis in 2 groups with the same category.

#2 As stated in the “Limitation” sections, the medication such as statin and/or treatment such as percutaneous coronary intervention (PCI) may affect the prognosis in ACS patients. Thus, the authors should provide such information.

#3 The authors adopted the different prognostic markers: R/S ratio in II lead and RDW in the present study. However, it seemed that RDW was not so important prognostic marker. Thus, the authors should clarify the relationship between RDW and prognosis and should strengthen the impact of RDW in the present study.

Reviewer's code: 02446694

Answer:

First of all thank you.

#1. The arrangement between the groups you specified was renewed. In addition, new cases were added to the discussion.

#2. The statins you specified were removed from the hospital system. statistics were made. No effect on the result.

#3. With the RDW you have specified, the discussion has been extended. The effect of RDW on prognosis was strengthened.
