

Reviewer #1:

Specific Comments to Authors: In this study, the authors concluded that patients with CHB treated with long-term NA therapy had a high probability of early renal injury, and early renal injury indicators were highly sensitive and could be used to monitor early renal impairment. To support the conclusion, the authors should examine the impact of diabetes mellitus on the renal function.

Reply: Thanks very much for the valuable comments. Considering the impact of diabetes mellitus on the renal function, we excluded patients with diabetes mellitus at the beginning of the study.
