Manuscript NO: 42452

Title: Esophagogastric Junction Outflow Obstruction: Where Are We Now in Diagnosis and Management?

Dear Editor,

We thank you and the reviewers for the interest in our manuscript and for the constructive comments. We have revised our manuscript as requested by the reviewers.

Reviewer 1:

- 
1. The advantages and disadvantages of various treatments of Esophagogastric junction outflow obstruction (EGJOO) should be described in detail in this paper.
  2. More content should be added. What are the current research progress and hotspots in Esophagogastric junction outflow obstruction (EGJOO)?

Response: thank you for your comments and suggestions. We have added a section discussing the LES directed treatment modalities (botulinum injection, pneumatic dilation, and POEM) and addressing their advantages and disadvantages. Most of the studies that are cited in the manuscript are recent and published within the last 2-3 years. The EGJOO is an evolving entity and more research is required to further elucidate this interesting diagnosis.

Reviewer #2:

1. This minireview will be useful to the reader to understand EGJOO entity. 2.

Inclusion of algorithm suggesting diagnostic approach to EGJOO would be useful.

Response: thank you for your comments and suggestions. As suggested, we have added a management algorithm to help the reader to better understand the treatment of this entity, as this is not one-size-fits-all management.
