

Answering Reviewers

Dear Reviewer,

Thanks for your comments.

1. According to the TCGA analysis data, the expression of survivin in HCC tissue was significantly associated with stage and tumor grade. The transcript per million of survivin expression in patients with stage III and IV HCC was significantly higher than that in patients with stage I and II HCC ( $P < 0.05$ ). And the transcript per million of survivin expression in patients with grade 3 and 4 HCC was significantly higher than that in patients with grade 1 and 2 HCC ( $P < 0.05$ ). You can see the results in supplementary figure 1 A and B.

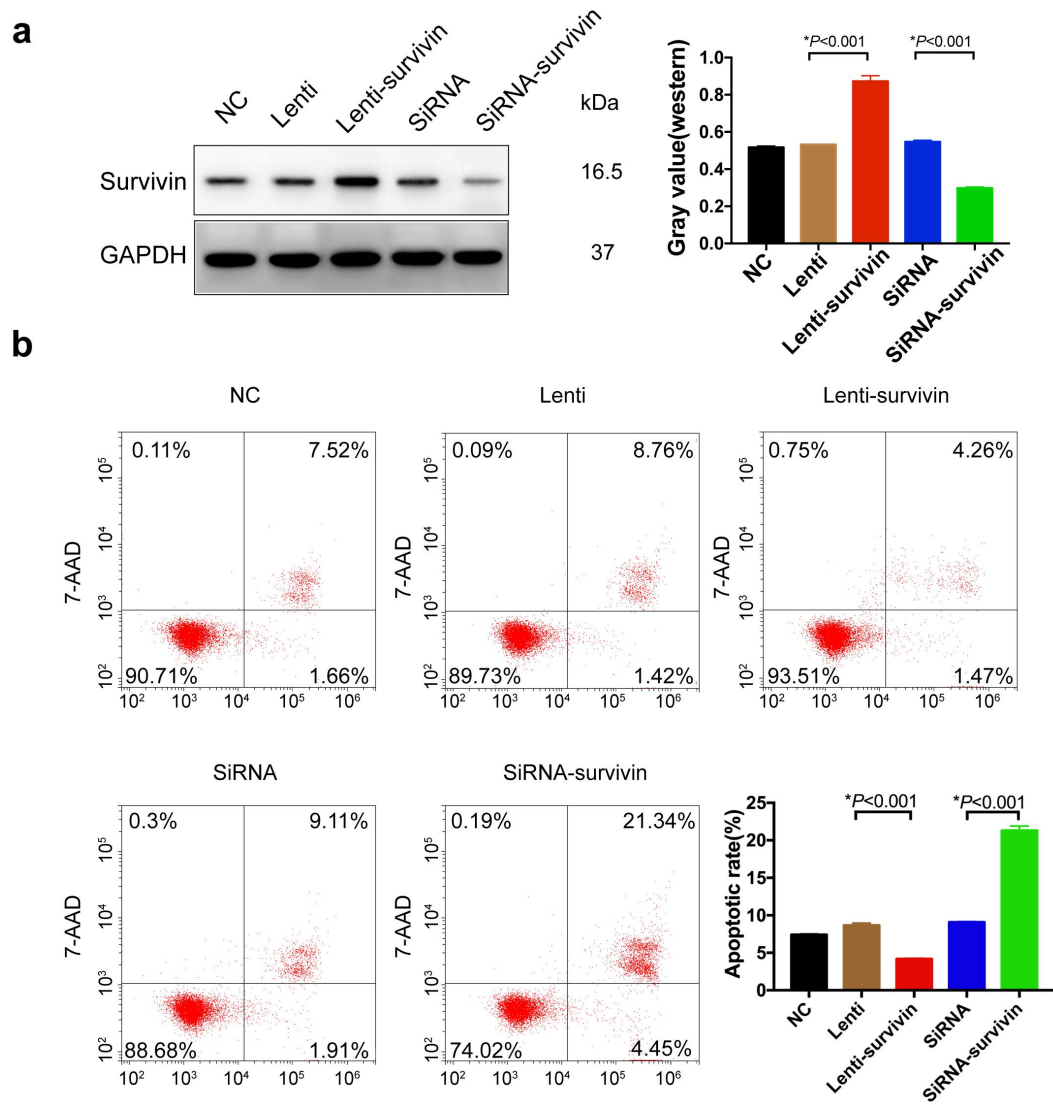

A.

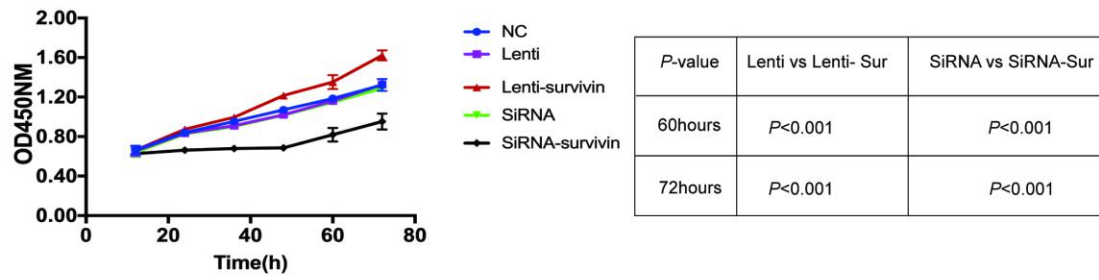

B.

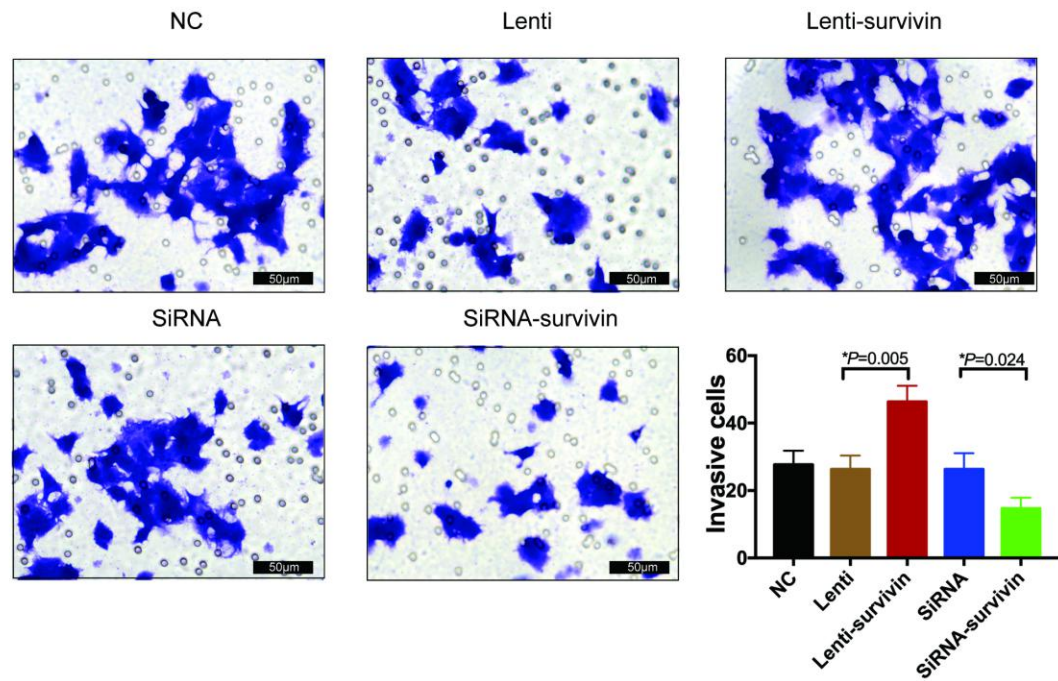

2. I revised the comparisons in figure 2 as below. Comparisons were made as Lenti. vs. Lenti-survivin, siRNA vs. siRNA-survivin.
