

This is an extensive review of the clinical significance of the tumor marker CEA. The authors included all relevant information for any reader - general practitioner to GI oncologist or surgeon. I suggest to narrow and shorten the conclusion, since it should contain only the most important information on the topic, also, this sentence should be deleted: "Advanced imaging techniques, especially contrast-enhanced MRI, have proven to be highly effective in detecting FLLs, offering superior diagnostic performance compared to CT and PET-CT, with potential implications for treatment planning and evaluation of liver metastases." Conflict of interest statement should be included in the article draft.

### **Answering Reviewers**

**The article language has been revised. Minor revision was made.**

**An attempt was made to shorten the Conclusion section as requested by the Reviewer (by removing a defined long sentence).**

**The Copyright License agreement statement was added to the article and also uploaded to the system as a form.**

The places where changes have been made are identified in yellow.
