**Name of Journal:** *World Journal of Orthopedics*

**ESPS Manuscript NO:** 30002

**Manuscript Type:** Meta-Analysis

*Reviewed by 03624313*

This is an interesting technique description. I have only some comments that in the abstract should provide a clear message of this report.

Response : The abstract have been revised in accordance to the review especially at the conclusion

*Reviewed by 03596860*

Dear Authors, Your article provides a systematic meta analysis of articles comparing cemented to uncemented and hybrid implants and evaluating the risks of revision surgery. I think overall it is well structured and extensively build up and therefore useful for the readers of this journal. However I think that the discussion section is poorly worked up. The authors should comment more on the findings of the meta analysis.

Response : Thank you for the review, more discussion have been added to the discussion section, including the findings of the metaanalysis.

This is a meta-analysis concerning the results after total hip replacement according to 3 different methods of implants' fixation; cemented, cementless and hybrid. This manuscript contains valuable information on this controversial topic. It is well presented. COMMENTS I believe that in the DISCUSSION section the authors should include some discussion concerning the existing literature (previous review or meta-analysis) on the same topic.

Response : Thank you for the review, similar with the previous comment: more discussion have been added to the discussion section, including the findings of the metaanalysis, we also include two previous meta-analysis on this topic for the discussion (Abdulkarim et al & Morshed et al)
