

Answering Reviewers

Dear reviewer,

Thank you for taking the time to review the manuscript.

Reviewer#1:

The table adds significant to your article; good work

Answer: We reported the main studies in a table and added a paragraph titled (Summary of Literature).

Reviewer#2:

You've only addressed the general issues associated with ABO-incompatible transplantation. Only authors with significant contribution in the experience and large number of publications in the field could follow this conduct in a review. I recommend you to do a literature review to find the studies actually reporting the ABO- incompatible Tx and list them in a table, reporting the protocols they've used for the desensitizations & immunosuppression, the success rates & various associated complications of their patients experienced, and then trying to make analyses to substantiate the reasons for either successes or complications (i.e. meta-analyses) accordingly. If you can't do these all; at least you may find the main studies in the field and report them in a table with the conducts and complications.

Answer: We reported the main studies in a table and added a paragraph titled (Summary of Literature).
