Name of Journal: *World Journal of Transplantation*

ESPS Manuscript NO: 21873

Manuscript type: REVIEW

Response to Reviewers' comments

Reviewer's code: 02567358

COMMENTS TO AUTHORS

It is a good candidate to be published in the journal.

Response: We cordially thank the reviewer for the positive comment regarding our manuscript.

Reviewer's code: 00503185

COMMENTS TO AUTHORS

It is a simple review to the topic and I suggest adding a clinical pathway figure and to summarize the most important cited results in a table.

Response: We thank the reviewer for the positive and constructive comment. We added 4 Tables to briefly present the most important points discussed in the body of the manuscript.

Reviewer's code: 03340937

COMMENTS TO AUTHORS

The Review by Filiopoulos et al. is a well-balanced overview on the current body of literature towards the topic. On the same time this is the strength but

also the shortcoming of this review, since it lacks a clear conclusion as well as the authors' recommendation based on the reported knowledge. I suggest adding a table that lists the pros and cons, limitations and indications of ECD, as well as a clear recommendation towards immunosuppressive therapy. The authors should also consider depicting the potential role of therapeutic drug monitoring in this setting.

Response: We thank the reviewer for the positive and constructive comment. We added a Table that lists pros and cons of ECD kidney transplantation and another one presenting main indications of ECD kidney transplantation as suggested by the Reviewer.

Furthermore, we added a paragraph in the final section of the manuscript to present in a more comprehensive and clear manner our recommendations regarding immunosuppressive treatment.

Lastly, our experience regarding drug levels monitoring in this setting is briefly discussed, although conclusive literature data regarding this issue are currently lacking.
