Timeline

Time	Event(s)
2010	The patient first noticed a small swelling at the right anterior palate
2015-2017	The swelling gradually increased in size, associated with intermittent toothache and occasional facial swelling
December 2017	<p>The patient presented to the local hospital and dental panoramic tomogram (DPT) was taken and revealed radiolucency with a well-defined sclerotic border of the right maxilla extending into the right maxillary sinus and significant root resorption of the upper central, lateral incisors, and upper right first molar.</p> <p>Excisional biopsy of the anterior palate swelling was performed under local anesthesia via an intraoral approach, with extraction of the upper right central and lateral incisors at the local hospital.</p>
April 2018	The patient noticed the swelling of the palate again, for which she was eventually referred to our institution for management of the right maxillary tumor
May 2018	Right subtotal maxillectomy and reconstruction with a vascularized free fibula flap were performed under the guidance of an intraoperative navigation system.
June 2018	The patient was in process of recovery post-operatively
November 2018	The patient was pleased with her post-operative appearance and functions
