

Scientific research process

This study explored the safety and efficacy of laparoscopic approach in treating hepatolithiasis. All the authors participated in this process. The authors did different jobs in this process, and all the work were administrated by corresponding author. All the data were truly. In this study, the authors investigate the perioperative outcomes of laparoscopic hepatectomy and conventional liver resection by pooling data from literatures that have already published. the novel findings of this study were the laparoscopic approach is safe and effective, with less intraoperative estimated blood loss, fewer postoperative complications, reduced length of hospital stay and shorter intestinal function recovery time than with conventional approaches.
